SAMPLE: fictional person, not a real result

Al Waha Genomics Laboratory (fictional)

Premarital Genetic Screening Report

Patient name: Aisha Khalfan (sample)
Sex: Female
Date of birth: 1999-03-14
Report date: 2026-10-20
Test: Premarital genetic screening, DoH panel (Premarital Screening Standard V3, Appendix 12), 563 genes
Partner: Rashid Khalfan (sample)
Declared relationship: First cousins

Results: variants reported

Gene	Variant (HGVS)	Protein	Zygosity	Classification	Associated condition
HBB	NM_000518.5:c.20A>T	p.Glu7Val (HbS)	Heterozygous	Pathogenic	Sickle cell disease
GJB2	NM_004004.6:c.35delG	p.Gly12fs	Heterozygous	Pathogenic	Nonsyndromic hearing loss
MEFV	NM_000243.3:c.442G>C	p.Glu148Gln	Heterozygous	Uncertain significance (VUS)	Familial Mediterranean fever

Couple analysis

Couple status: AT RISK (not compatible)

Both partners carry a pathogenic variant in: HBB

Partner's variant in the shared gene: HBB c.92+5G>C (beta-plus thalassaemia)

Your partner was tested for your other carrier variants and none was found in: GJB2

Methods and limitations

Analytical sensitivity: the panel detects 95% of disease-causing single-nucleotide variants and small insertions or deletions in the panel genes.

Targeted analysis of the partner's sample for your familial variant: 99% sensitivity.

This test does not detect all genetic disorders. A negative result reduces but does not remove the chance of being a carrier.
